1 Introduction

The 486 PCI mainboard is a high-performance system board that supports Intel 486DX2/DX/SX/SL Enhanced 486, P24T, P24D, DX4, Cyrix, AMD, and UMC CPUs. The mainboard is fully compatible with industry standards, while incorporating many technical enhancements.

The 486 PCI mainboard offers superior system performance, compatibility, and reliability, and is the ideal choice for a wide variety of system applications.

Key Features

- Fully AT compatible. Supports Intel 486DX2/DX/SX/SL Enhanced 486, P24T, P24D, 486DX4 (P24C), Cyrix, UMC and AMD CPUs.
- Supports Power Management Mode
 - Supports the SMM and the SMI
 - CPU Stop Clock Function
 - Four Power Saving States (normal / doze / standby / suspend)
 - Supports the APM control
 - Supports Sleep Switch control
 - Power Saving also on non-SMI CPU
 - More System Event Monitoring and Power Saving Control
- Direct map cache controller that supports 256K and 512K
- Fast page burst mode DRAM controller
- Memory configurations from 1MB to 255MB using combinations of 80ns 256K, 512K, 1M, 2M, 4M, and 16M SIMM modules. Uses four 72-pin DRAM modules in **unrestricted configurations (Table Free)**.
- Hardware turbo speed switch
- Four 16-bit ISA slots, three master PCI slots, 1 slave PCI slot, and 1 slave VESA slot
- Support for 5V and 3.45V / 3.6V / 4.0V CPU
- On-board local bus IDE Controller and Floppy Controller
- Built-in NCR 810 PCI SCSI driver
- On-board supports for two high speed UARTS (W/16550 FIFO) and multimode parallel port for standard, Enhanced (EPP) and high speed (ECP) modes
- FLASH Memory BIOS with Plug and Play Function
- On-board built-in PS/2 mouse function.

Unpacking the Mainboard

The mainboard package contains:

- The 486 PCI/VESA Mainboard
- This User's Guide

Note: Do not unpack the mainboard until you are ready to install it.

Follow the precautions below while unpacking the mainboard.

1. Before handling the mainboard, ground yourself by grasping an unpainted portion of the system's metal chassis.
2. Remove the mainboard from its anti-static packaging and place it on a grounded surface, component side up.
3. Check the mainboard for damage. If any chip appears loose, press carefully to seat it firmly in its socket.

Do not apply power if the mainboard appears damaged. If there is damage to the board contact your dealer immediately.

Electrostatic Discharge Precautions

Make sure you ground yourself before handling the mainboard or other system components. Electrostatic discharge can easily damage the components. Note that you must take special precaution when handling the mainboard in dry or air-conditioned environments.

Abide by the precautions below to protect your equipment from electrostatic discharge:

- Do not remove the anti-static packaging until you are ready to install the mainboard and other system components.
- Ground yourself before removing any system component from its protective anti-static packaging. To ground yourself, grasp the expansion slot covers or other unpainted portions of the computer chassis.
- Frequently ground yourself while working, or use a grounding strap.
- Handle the mainboard by the edges and avoid touching its components.

Mainboard Layout w/ Default Settings*

*Default settings are for an Intel DX4-100 SL Enhanced CPU (3.45V), 256K cache (Winbond TAG RAM), IDE on-board, and power saving controlled by SMOUT signal (JP15).

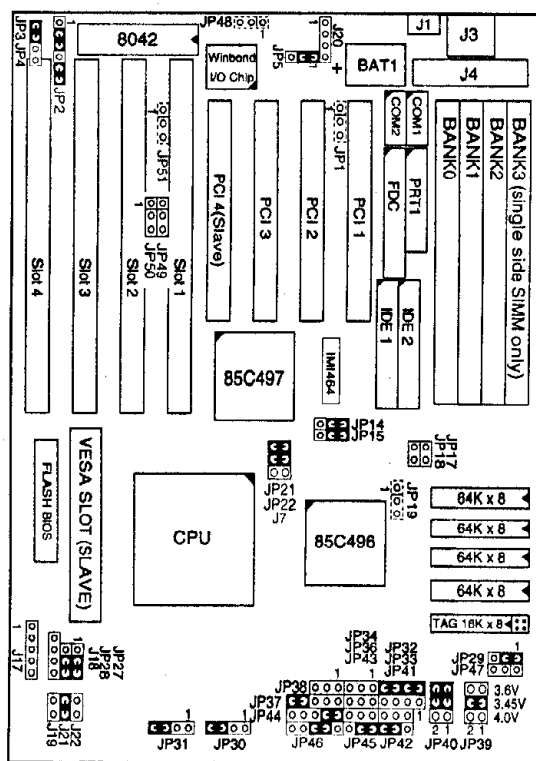

Figure 1-1. Mainboard Layout

Note: If you use a CPU not listed in this manual, please contact your dealer to determine the correct CPU settings.

2 Hardware Setup

This chapter explains how to set jumpers, install a processor and memory on the mainboard and make case connections. Refer to this chapter whenever you upgrade or reconfigure the system.

CAUTION: Turn off power to the mainboard, system chassis, and peripheral devices before performing any work on the mainboard or system.

Jumpers

Factory Set Jumpers

The following jumpers are set at the factory as below.

Jumpers	Factory settings
JP48, JP51	Reserved
JP2(5-6)	Factory fixed at Short
JP12, JP1, JP15	Factory fixed at 1-2
JP27, JP28, JP19	Factory fixed at 2-3

JP5: CMOS Reset Jumper

JP5 lets you discharge CMOS memory in the event you forget your password or encounter a BIOS Setup problem. Before you install the mainboard make sure that JP5 is set to retain CMOS memory.

CMOS Setting	JP5
Retain CMOS Data (Default)	
Discharge CMOS	

J7: Sleep Switch Connector

Toggle this jumper to force the system to enter suspend mode. Press any key or move the input device to wake up the system to full speed mode.

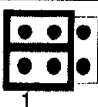

JP15: Stopped Clock Generator Select (Fixed at 1-2)

Jumper JP15 sets the STPCLK or SMOUT signal for stopping the clock generator.

Setting	JP15
Stopped by SMOUT for all CPUs. (Default)	
Stopped by STPCLK for all CPUs except AMD DXL CPUs.	

JP49~50: ECP DMA Select

These jumpers set the ECP DMA for DRQ3/DACK3 or for DRQ1/DACK1.

ECP DMA Select	JP49/JP50
DRQ1/DACK1	
DRQ3/DACK3	
None (Default)	

JP3: Display Type Settings

JP3 configures the mainboard for use with a color or monochrome monitor.

Display Type	JP3
Monochrome	
Color/EGA/VGA (Default)	

JP4: PS/2 Mouse Function Jumper

Set PS/2 mouse function enabled or disabled.

PS/2 Mouse Function	JP4
Disabled (default)	
Enabled	

Note: The IRQ12 is dedicated to PS/2 mouse when choose enabled of PS/2 Mouse Function.

Multi I/O Port Address

Default settings for multi-I/O port addresses are shown in the following table.

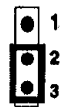

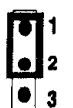

Port	I/O Address	IRQ	Status
LPT1*	378H	7	Standard Parallel Port
COM1	3F8H	4	
COM2	2F8H	3	

* LPT1 is default for standard mode. If you want ECP/EPP functions, you must use the BIOS or drivers settings. You must also set JP49 and JP50 to configure DRQ/DACK. If the default I/O port addresses conflict with other I/O cards (e.g., sound cards or I/O cards), you must adjust one of the I/O addresses to avoid address conflict. (You can adjust these I/O port addresses from the BIOS, see page 28.)

Note: Some sound cards have a default IRQ setting for IRQ7, which may conflict with printing functions. If this occurs, do not use the sound card functions the same time as you print.

JP2: EPROM/FLASH Memory Select Jumper

Set EPROM or FLASH memory type with Jumper JP2.

Type	JP2
EPROM/FLASH (non-program)	
FLASH memory (program)	

CPU Type Configuration

Configure the 486 PCI mainboard's CPU by inserting the specified CPU and setting jumpers as described in the diagrams that follow. Note that the CPU Type jumpers on the mainboard have yellow caps and the Clock Setting jumpers have red caps.

Intel 486SX/SX SL-Enhanced CPU

486SX-25/33 Setting

486SX2-50*/66* Setting

Figure 2-1. 486SX/SX SL-Enhanced CPU Jumper Settings

* For these CPUs, a cooling fan is necessary for system stability.

DX2-66*/80* (5V)

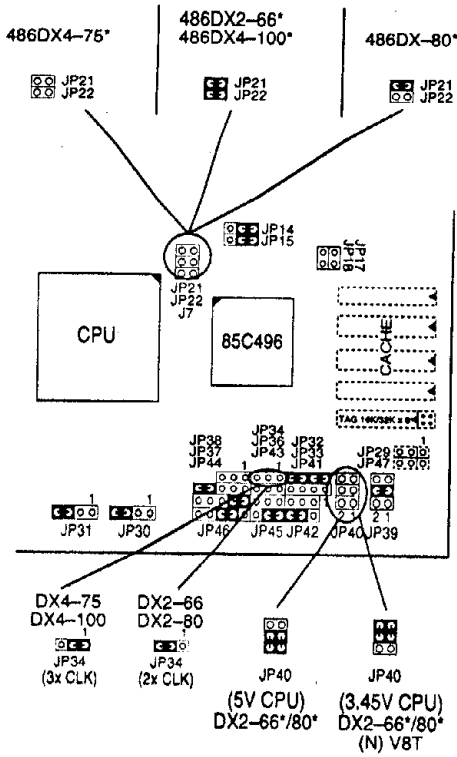

Figure 2-9. AMD 486DX CPU Jumper Settings

* For these CPUs, a cooling fan is necessary for system stability.

AMD 486DX Enhanced Plus CPU (Internal Write-Back Cache)

486DX2-66*/80* CPU(N)V8B (3.45V)

486DX4-75*/100*/120* CPU (N)V8B (3.45V)

Figure 2-10. AMD 486DX Enhanced Plus CPU Jumper Settings

* For these CPUs, a cooling fan is necessary for system stability.

AMD X5 CPU (Internal 16K Write-Back Cache)

X5-133/150/160 (3.45V) Settings

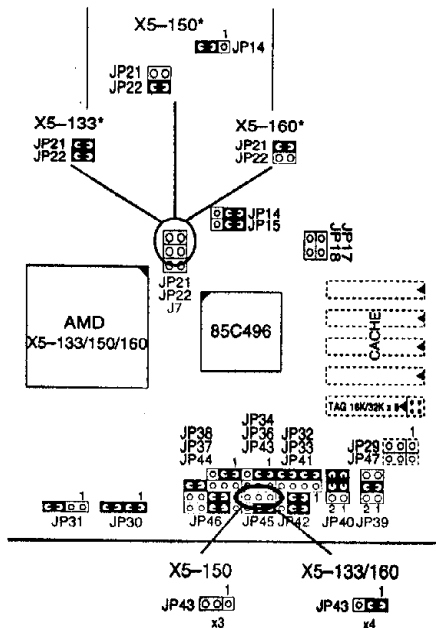

Figure 2-11. AMD X5 CPU Jumper Settings

* For these CPUs, a cooling fan is necessary for system stability.

Cache Configuration

The 486 PCI mainboard has a write-back caching scheme. You can configure the mainboard's external cache for 256KB or 512KB by setting jumper switches and installing cache chips. Refer to the following pages for jumper switch settings and cache socket locations.

Cache Jumper Settings

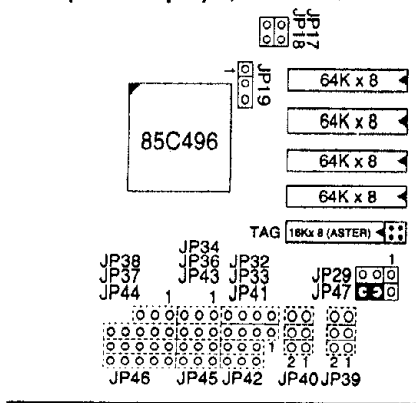

You must set jumpers JP47 and JP29 to configure cache size. See the illustrations below. Note that cache jumpers on the mainboard have white jumper caps.

Cache Size and RAM Locations

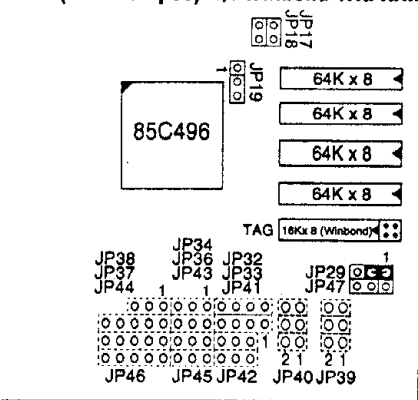

You can configure cache size using 64Kx8 or 128Kx8 cache chips. The table below describes chip type and socket locations for each configuration.

Cache Size	Cache RAM	Tag RAM	WB Cacheable Range
256KB	64K x 8 / U18, U20, U22, U23	32K x 8 / U32 or 16K x 8 / U32	32MB
512KB	128K x 8 / U18, U20, U22, U23	32K x 8 / U32	64MB

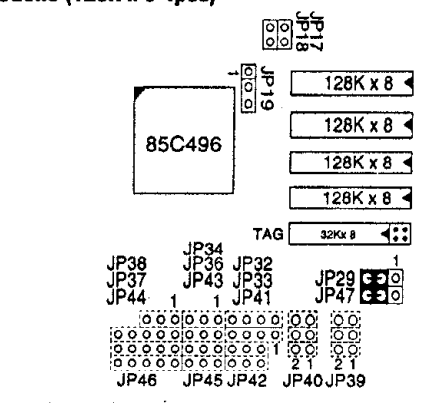

Note: Tag and Data RAM use 20ns for all conditions.

256K Cache (64K x 8 4pcs) w/ Aster TAG RAM

* This setting is for ASTER 16K x 8 TAG RAM.

256K Cache (64K x 8 4pcs) w/ Winbond TAG RAM

* This setting is for Winbond 16K x 8 TAG RAM.

512K Cache (128K x 8 4pcs)**Memory Configuration**

The mainboard supports four banks of 72-pin SIMM (Single In-line Memory Modules). The mainboard requires SIMM of at least 80ns access time. Also support **with parity (x36)** or **without parity (x32)**. There are no restrictions on memory configuration. You can install DRAM in any combination without having to rely on a memory configuration table. Memory configuration is thus "Table-Free".

Single-Sided SIMM	Double-Sided SIMM
1MB = 256K x 36(32)	2MB = 512K x 36(32)
4MB = 1MB x 36(32)	8MB = 2MB x 36(32)
16MB = 4MB x 36(32)	32MB = 8MB x 36(32)
64MB = 16MB x 36(32)	

Note **BANK3 supports only single side SIMM.**

Connectors

Attach the 486 PCI mainboard to case devices, or an external battery, via connectors on the mainboard. Refer to Figure 1-1 for connector locations and connector pin positions.

J17 – Keylock & Power LED Connector

J17 is a connector for a lock that may be installed on the system case for enabling or disabling the keyboard. J17 also attaches to the case's Power LED.

J18 – Speaker Connector

Attach the system speaker to connector J18.

J19 – Hardware Reset Control

Attach the Reset switch to J19. Closing the Reset switch restarts the system.

J20 – External Battery Connector

J20 is a 4-pin connector to which you can attach an external battery. Pin 1 of J20 is positive (+) and pin 4 is negative (-).

J21 – Turbo Switch Connector

J21 is connected to a Turbo switch on the front of the system case. The connector's pins are opened for normal operation and shorted for turbo operation.

J22 – Turbo LED Connector

J22 connects to a Turbo LED on the case control panel and works with the Turbo Switch. If the mainboard is in Turbo mode, the Turbo LED lights. When the LED flashes, it means the system has entered power saving mode.

J1 – PS/2 Mouse Connector

Attach PS/2 mouse cable to this connector.

J3 – Keyboard Connector

A five-pin female DIN keyboard connector is located at the rear of the board. Plug the keyboard jack into this connector.

J4 - Power Supply Connectors

The mainboard requires a power supply with at least 200 watts and a "power good" signal. J4 has two six-pin male header connectors.

Plug the dual connectors from the power directly onto the board connector while making sure the black leads are in the center.

JP18 – On-board Primary Hard Disk LED Connector**JP17 – On-board Secondary Hard Disk LED Connector****J6 – On-board Primary Hard Disk Connector****J5 – On-board Secondary Hard Disk Connector**

You can enable/disable on-board IDE via BIOS control (see page 28).

FDC1 Connector

Attach floppy cable to this connector.

PRT1 Connector

Attach parallel port cable to this connector.

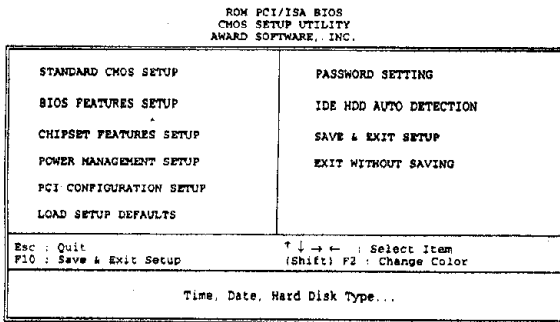

COM1/COM2 Connectors

Attach COM1/COM2 cable to these connectors.

3 BIOS Setup

The mainboard's BIOS setup program is the ROM ISA BIOS from Award Software Inc. Enter the Award BIOS program's Main Menu as follows:

1. Turn on or reboot the system. After a series of diagnostic checks, you are asked to press DEL to enter Setup.
2. Press the key to enter the Award BIOS program and the main screen appears:

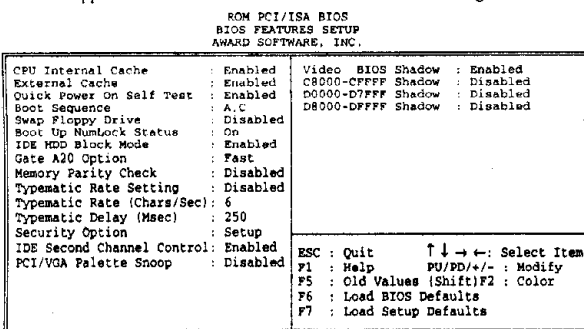

3. Choose an option and press <Enter>. Modify the system parameters to reflect the options installed in the system. (See the following sections.)
4. Press <ESC> at anytime to return to the Main Menu.
5. In the Main Menu, choose "SAVE AND EXIT SETUP" to save your changes and reboot the system. Choosing "EXIT WITHOUT SAVING" ignores your changes and exits the program.

The Main Menu options of the Award BIOS are described in the sections that follow.

BIOS Features Setup

Run the BIOS Features Setup as follows.

1. Choose "BIOS FEATURES SETUP" from the Main Menu and a screen with a list of items appears. (The screen below shows BIOS default settings.)

2. Use the arrow keys to move between items and select values. Modify selected fields using PgUp/PgDn/+/- keys. <F> keys are explained below:

- <F1>: "Help" gives options available for each item.
- Shift <F2>: Change color.
- <F5>: Get the old values. These values are the values with which the user started the current session.
- <F6>: Load all options with the BIOS Setup default values.
- <F7>: Load all options with the Setup default values.

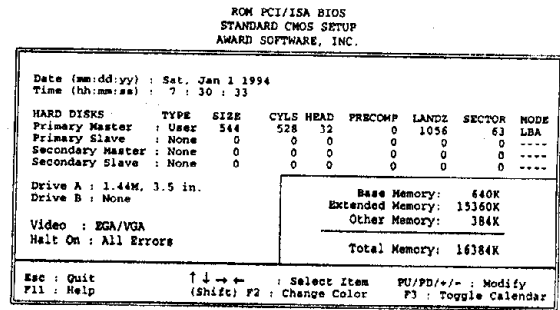

A short description of screen items follows:

- CPU Internal Cache** This option enables/disables the CPU's internal cache memory. (The Default setting is Enabled.)
- External Cache** This option enables/disables the external cache memory. (The Default setting is Enabled.)
- Quick Power On Self Test** Enabled provides a fast POST at boot-up.

Standard CMOS Setup

Run the Standard CMOS Setup as follows.

1. Choose "STANDARD CMOS SETUP" from the Main Menu. A screen appears.

2. Use arrow keys to move between items and select values. Modify selected fields using PgUp/PgDn/+/- keys. Some fields let you key in values directly.

- Date (mm/dd/yy)** Type the current date.
- Time (hh:mm:ss)** Type the current time.
- Primary (Secondary) Master & Slave** Choose from the standard hard disk types 1 to 46. Type 47 is user definable. If a hard disk is not installed choose "Not installed." (default)
- Drive A & B** Choose 360KB, 5 1/4", 1.2MB, 5 1/4", 720KB, 3 1/2", 1.4M, 3 1/2"(default), 2.88 MB, 3 1/2" or Not installed
- Video** Choose Monochrome, Color 40x25, VGA/EGA (default), Color 80x25

3. When you finish, press the <ESC> key to return to the Main Menu.

- Boot Sequence** The default setting attempts to first boot from drive A: and then from hard disk C:. You can reverse this sequence with "C: A:", but then drive A: cannot boot directly.
- Swap Floppy Drive** Enabled changes the sequence of the A: and B: drives. (The Default setting is Disabled.)
- Boot Up Num Lock Status** Choose On or Off. On puts numeric keypad in Num Lock mode at boot-up. Off puts this keypad in arrow key mode at boot-up.
- IDE HDD Block Mode** This option enables/disables the IDE HDD Block Mode function. Not all HDDs support this function.
- Gate A20 Option** Choose Fast or Normal. Fast allows RAM accesses above 1MB using the fast gate A20 line.
- Memory Parity Check** This option enables / disables the memory parity check function. (The Default setting is Disabled.)
- Typematic Rate Setting** Enable this option to adjust the keystroke repeat rate.
- Typematic Rate (Chars/Sec)** Choose the rate a character keeps repeating.
- Typematic Delay (Msec)** Choose how long after you press a key that a character begins repeating.
- Security Option** Choose Setup or System. Use this feature to prevent unauthorized system boot-up or use of BIOS Setup. "System" - Each time the system is booted the password prompt appears. "Setup"- If a password is set, the password prompt only appears if you attempt to enter the Setup program.
- IDE Second Channel Control** Choose Enabled or Disabled. When Enabled is set, IRQ15 is dedicated for secondary IDE use. When Disabled is set, IRQ15 is released for other devices.

- PCI/VGA Palette Snoop** Enabled: The color of monitor will be incorrect if uses with MPEG card. Enable this option to make the monitor normal. Notice that the VGA card must support snoop function.
- Disabled: Default setting.
- Video or Adapter BIOS Shadow** BIOS shadow copies BIOS code from slower ROM to faster RAM. BIOS can then execute from RAM. These 32K segments can be shadowed from ROM to RAM. BIOS is shadowed in a 32K segment if it is enabled and it has BIOS present.
3. After you have finished the BIOS Features Setup program, press the <ESC> key and follow the screen instructions to save or disregard your settings.

Chipset Features Setup

The Chipset Features Setup option changes the values of the chipset registers. These registers control system options in the computer.

Note: Change these settings only if you are familiar with the Chipset.

Run the Chipset Features Setup as follows.

1. Choose "CHIPSET FEATURES SETUP" from the Main Menu and the following screen appears. (The screen below shows default settings.)

ROM PCI/ISA BIOS CHIPSET FEATURES SETUP AWARD SOFTWARE, INC.			
Auto Configuration	: Enabled	Onboard 496B IDE Port	: Both
ISA Bus Clock Option	: 1/4 PCLK	IDE0 Master Mode	: Auto
LBD# Sample Point	: End of T2	IDE0 Slave Mode	: Auto
DRAM Speed	: Faster	IDE1 Master Mode	: Auto
DRAM Write Cycle	: 1 WS	IDE1 Slave Mode	: Auto
DRAM Write CAS Pulse	: 2 CCLK	Onboard PDC Control	: Enabled
CPU Internal Cache	: Write Thru	Onboard Serial Port 1	: COM1
CPU Burst Write	: Disabled	Onboard Serial Port 2	: COM2
L2 Cache Policy	: Write Back	Onboard Parallel Port 1	: 378H
Cache Write Cycle	: 2 CCLK	Onboard Printer Mode	: EPP/SPP
Cache Burst Read Cycle	: 1 CCLK	Serial Port 1 MIDI	: Disabled
L2 Cache/DRAM Read Cycle	: 2 CCLK	Serial Port 2 MIDI	: Disabled
ESC : Quit ↑ ↓ → ← : Select Item			
F1 : Help PU/PD/+/- : Modify			
F5 : Old Values (Shift)F2 : Color			
F6 : Load BIOS Defaults			
F7 : Load Setup Defaults			

- Onboard FDC Control** Enabled: Use the on-board floppy controller (default).
Disabled: Turn off the on-board floppy controller.
- Onboard Serial Port 1** Choose serial port 1 & 2's I/O address. Do not set port 1 & to the same value except for Disabled.
- Onboard Serial Port 2** COM 1/3F8H | COM 3/3E8H
COM 2/2F8H | COM 4/2E8H
(default)
- Onboard Parallel Port** Choose the printer I/O address: 378H (default), 278H, 3BCH.
Note: Under Windows 95, you can choose only 378H or 278H.
- Onboard Printer Mode** Choose EPP/SPP (default), ECP/EPP, ECP mode. The mode depends on your external device that connects to this port.
- Serial Port 1/2 MIDI** For future function.

3. After you have finished with the Chipset Features Setup, press the <ESC> key and follow the screen instructions to save or disregard your settings.

Power Management Setup

The Power Management Setup option sets the system's power saving functions.

Run the Power Management Setup as follows.

1. Choose "POWER MANAGEMENT SETUP" from the Main Menu and a screen with a list of items appears.

2. Use the arrow keys to move between items and select values. Modify selected fields using the PgUp/PgDn/+/- keys.

A short description of screen items follows:

Auto Configuration Enable this option (strongly recommended) and the system automatically sets all options on the left side of the screen (except cache update mode & BIOS cacheable).

If this option is Enabled you must boot from Turbo mode.

ISA Bus Clock The default setting is 1/4 PCLK (assuming PCLK is 33MHz.) It is recommended that you do not change this setting. This value should be close to 8MHz.

LBD# Sample Point Use the default setting.

DRAM Speed Automatically set by BIOS.

DRAM Write Cycle Automatically set by BIOS.

DRAM Write CAS Pulse Automatically set by BIOS.

CPU Burst Write Choose Enabled or Disabled. The default is Disabled.

L2 Cache Policy Choose Write-through or Write-back. The default is Write-back.

Cache Write Cycle Use the default setting.

Cache Burst Read Cycle Use the default setting.

L2 Cache / DRAM Cycle WS Use the default setting.

Onboard 496B IDE Port Choose Both (default) or Disabled. The Enabled setting enables both primary and secondary IDEs. The Disabled setting turns off the primary IDE and the Secondary IDE.

IDE 0/1 Master/Slave Mode Choose Auto (default) or 0,1,2,3,4. The 0-4 settings are for IDE mode speed. (Mode 0 is the slowest speed, Mode 4 is the fastest). Unless you know the HDD speed, you should use the Auto setting for more reliable and better performance.

ROM PCI/ISA BIOS POWER MANAGEMENT SETUP AWARD SOFTWARE, INC.

User Define Let's you define the HDD and system power down times.

Disabled Disables the Green PC Features.

Max/Min Saving Doze Mode = 10 Sec/40 Min.,
Standby Mode = 10 Sec/40 Min.,
Suspend Mode = 10 Sec/40 Min.

PM Control by APM Choose Yes or No (default). APM stands for Advanced Power Management. To use APM you must run "power.exe" under DOS v6.0 or later version.

Video Off Method When Suspend mode occurs, the monitor screen shuts off. If any IRQ event occurs, the screen comes back on.

PM Interrupt Use This item is only valid for Non-SMI CPUs. It is recommended that you use the default setting (IRQ12). (Assign the Non-SMI routine to a dedicated IRQ.)

- HDD Off After** When the set time has elapsed, the BIOS sends a command to the HDD to enter standby (sleep) mode, which turns off the motor. Time is adjustable from 1 to 15 minutes. The default setting is Disabled. Some older model HDDs may not support this advanced function.
 - Doze Mode** When the set time has elapsed, the BIOS sends a command to the system to enter doze mode (system clock drops to 8MHz). Time is adjustable from 10 Sec to 40 Min.
 - Standby Mode** When the set time has elapsed, the BIOS sends a command to the system to enter Standby mode (system clock drops to 8MHz). Time is adjustable from 10 Sec to 40 Min.
 - Suspend Mode** When the set time has elapsed, the BIOS sends a command to the system to enter Suspend mode (system clock drops to 8MHz). Time is adjustable from 10 Sec to 40 Min.
 - PCI Master Activity** The hardware monitors the master signals for activity. If activity occurs from the Enabled item, the system will not enter Green mode (power saving).
 - xxx Ports Activity** The hardware monitors these ports for activity. If activity occurs from the Enabled item the system will not enter Green mode (power saving).
 - IRQx** The BIOS monitors these items for activity. If activity occurs from the Enabled item the system will not enter Green mode (power saving).
3. After you have finished with the Power Management Setup, press the <ESC> key to return to the Main Menu.

- PCI IDE IRQ Map To** Select PCI-AUTO, ISA, or assign a PCI SLOT number (depending on which slot the PCI IDE is inserted). The default setting is PCI-AUTO. If PCI-AUTO does not work, then assign an individual PCI SLOT number.
 - Primary IDE INT#** Choose INTA#, INTB#, INTC#, or INTD#. The default setting is INTA#.
 - Secondary IDE INT#** Choose INTA#, INTB#, INTC#, or INTD#. The default setting is INTB#.
 - Master Arbitration Protocol** Choose Weak (default) or Strong. Choose Weak and the CPU has 1st priority, 2nd is PCI and 3rd is Master Device. Choose Strong and the CPU, PCI, and Master Device all have the same priority.
 - CPU->PCI Mem Post Write Buf** Choose Enabled (default) or Disabled.
 - CPU->PCI Mem Burst/Write** Choose Enabled (default) or Disabled.
 - PCI Master Burst Read/Write** Choose Enabled (default) or Disabled.
3. After you have finished with the PCI Slot Configuration, press the <ESC> key and follow the screen instructions to save or disregard your settings.

Load Setup Defaults

This item loads the system values you have previously saved. Choose this item and the following message appears:

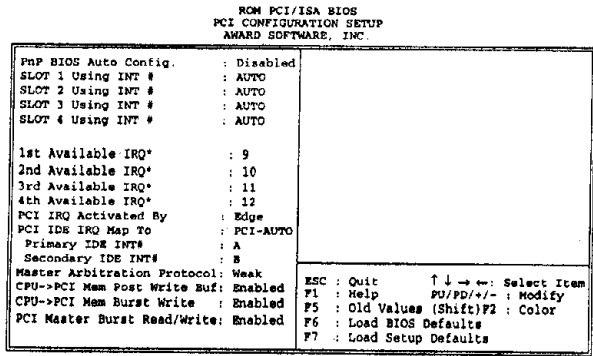

"Load SETUP Defaults (Y/N)? N"

To use the SETUP defaults, change the prompt to "Y" and press <Enter>.

PCI Configuration Setup

This option sets the mainboard's PCI Slots. Run this option as follows:

1. Choose "PCI CONFIGURATION SETUP" from the Main Menu and the following screen appears. (The screen below shows default settings.)

* These options will disappear when PnP BIOS Auto Config. is enabled.

2. Use the arrow keys to move between items and select values. Modify selected fields using the PgUp/PgDn/+/- keys.

A short description of screen items follows:

- PnP BIOS Auto Config.** Disabled: BIOS doesn't manage ISA PnP card (i.e., IRQ) but PCI card.
Enabled: BIOS auto manage PCI and ISA PnP card.
- Slot 1 (2) (3) (4) Using INT#** Choose AUTO or assign PCI INT# number A, B, C, or D. The default setting is AUTO.
- 1st (2nd) (3rd) (4th) Available IRQ** If slot 1~4 is set to AUTO in the item above, then the BIOS automatically routes the INT# to the specified IRQ following the 1st (2nd) (3rd) (4th) IRQ order you assign.
- PCI IRQ Activated By** Choose Edge or Level. Most PCI trigger signals are Level. This setting must match the PCI card.

Password Setting

This Main Menu item lets you configure the system so that a password is required every time the system boots or an attempt is made to enter the Setup program. Change the password as follows:

1. Choose "PASSWORD SETTING" in the Main Menu and press <Enter>. The following message appears:

"Enter Password:"

2. Enter a password and press <Enter>. (If you do not wish to use the password function, you can just press <Enter> and a "Password disabled" message appears.)

3. After you enter your password, the following message appears prompting you to confirm the new password:

"Confirm Password:"

4. Re-enter your password and then Press <ESC> to exit to the Main Menu.

Important: If you forget or lose the password, the only way to access the system is to set jumper JP5 to clear the CMOS RAM. All setup information is lost and you must run the BIOS setup program again.

IDE HDD Auto Detection

This Main Menu item automatically detects the hard disk type and configures the STANDARD CMOS SETUP accordingly.

Note: This function is only valid for IDE hard disks.
