SECTION 1

INTRODUCTION

1.1 Overview

- FT-432A offers a 32-bit programming architecture compatible with the software base of the 486 microprocessor. It is a reliable motherboard using a UM8C chipset and a multi-layer printed circuit board. The chipset consists of UM8880F and UM8880AF which provides the most cost effective and high performance solution for a 486 computer system and APT1200VA I/O chip which provides the enhanced I/O functions.
- The UM8880F is a Host Bridge compliant to PCI spec. 2.0 for 486 mother board which contains a sophisticated 8Kbit-mapped cache controller with write-back or write through operation, fast page mode DRAM Controller, and supports 64KB management mode operation. The UM8880AF provides the bridge between the PCI bus and ISA bus. Enhanced DMA function, incorporates two MCI/F interrupt controller, one 8259+ 16-bit counter/timer, I/O control logic, built-in hardware keyboard controller, RTC and NVSRAM driver interface, primary and secondary PCI I/O controller interface.
- FT-432A is a PCI Local Bus motherboard. The slow PCI bus data fully comply with the PCI spec. v2.0. The speed of I/O peripherals can be dynamically increased by inserting PCI compatible controller cards on the PCI bus slots on the FT-432A.
- FT-432A offers you the option for an excellent CPU upgrade path. Designed to work with most brands of 486 CPUs such as 486SDX and DX2, this motherboard has been equipped with an option for lowering the voltage of the CPU down to 3.3V in order to enable use with Intel's AMD DX4 CPUs (and other 3.3Vdc CPUs), allowing up to 120MHz speeds. This option is in the form of a CMOS invertor/diagnostic board is fully described in Section 2.3 of this manual.
- FT-432A supports Plug and Play by using a 1MB Flash ROM which provides 4KB of NVSRAM for storing the extended system configuration data.
- FT-432A is a green design mother-board which enters when there is no system activity for a specific period of time (this period is software programmable), the FT-432A will slow down its original working frequency to 8 MHz speed when used with slower CPUs. If an "SMM" System Management Mode CPU is used, the green feature of FT-432A slows down the CPU clock to zero. This will help save the power consumption, reducing energy related pollution and prevent our environment.

This is an ENERGY STAR™ compliant product.

The Environmental Protection Agency ENERGY STAR™ program defines that as an Ally of this program the qualified manufacturer must produce systems, or system components which enable a computer system to operate and draw 30 watts or less of power in idle mode. Although the EPA does not enforce any particular product or service, the program is designed to offer a cooperative effort between the EPA and the computer manufacturers (AM) to provide energy saving products and education to customers.*

It runs with Network

The FT-432A was authorized by Pivotal to use the Novel! Yes, It runs with Network words/trade mark.

SECTION 1 INTRODUCTION

1.1 Overview

FCC Approval

The FT-422A multifunction has been approved for FCC Class B when properly installed in a hardware configuration using the following case/power supply:

Brand	Model	FCC ID
Power	PC-305 204	3P79C0245D1139
Power	PC-309 150	3P79C0245D1009
Power	PC-308 150	3P79C0245D1008

FCC Notice

Information to the User

This equipment has been tested and found to comply with the limits for a Class B digital device, per part of Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Should you experience interference to radio or television reception then the user is encouraged to try to correct this interference by one or more of the following measures:

- Re-locate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help and for additional suggestions.

The user may find the following booklet prepared by the Federal Communications Commission helpful: "How to Identify and Resolve Radio-Frequency Interference Problems." This booklet is available from the U.S. Government Printing Office, Washington, DC 20540, Stock No. 304-006-001-15-4.

FCC Warning

The user is advised that changes or modifications not expressly approved by the manufacturer could void the user's authority to operate this equipment.

Note: In order for an installation of this product to maintain compliance with the limits for a Class B device, shielded cables and power cord must be used.

1.2 Checklist

Please check your FT-422A package to ensure that it contains the following items:

- FT-422A Main Board
- FT-422A User's Manual
- FT-422A PCI BUS Driver Diskette
- Two IDE cables
- One FDD cable
- One USB + 25 Serial cable with bracket
- One DB25 game cable + DB25 printer cable with bracket

If any of these items are missing or damaged, please contact your local dealer or sales representative for assistance.

SECTION 1 INTRODUCTION

1.3 Green PC Power Management

The Green PC mode is a state that minimizes power consumption. There are three different Green PC modes:

- 1) Doze mode. This mode is available for all kinds of CPUs. The clock of the CPU will slow down to 1 MHz.
- 2) Standby mode. This mode is only available for the 586M CPUs. The clock of the CPU will slow down to the preset frequency.
- 3) Suspend mode. This mode is only available for the 586M CPUs. The FT-422A can stop the CPU clock under this mode.

The FT-422A will be placed into Green PC mode as a result of one of the following events:

- Suspended mode (S1) is present.
- Suspension of the Interval Green PC Time. The Green PC Time is software programmable which can configure in the "Power Management Setup" option of the BIOS CMOS setup. (Refer to 3.10: Power Management Setup). The power management feature will be enabled as default, however the timing may differ due to production spread. It is recommended that you re-adjust these timings according to your personal requirements.
- Execution of the system hot key for power down requesting (CTRL+ALT+P).

Through system activity monitoring and management, the FT-422A will not go into Green PC mode if any of the following activity is detected:

- PCI device activity
- LPT port activity
- COM port activity
- ISA master activity
- IDE activity
- Floppy activity
- VGA activity
- Keyboard activity

SECTION 1

2.1 PT-422A System Board Specifications

- Supports 4 pins of 12 pins SMD (single or double back) up to 256MB on board memory.
- Auto configure memory size without hardware jumper.
- 25K, 128K, 256K, 512K, 1MB memory size selectable.
- Fast CPU reset and Paragon A20 logic.
- Speed switching with hardware and software selective.
- Stand-by timer 155min by 10min.
- Four 16-bit ISA slots, three PCI slots.
- Clock chip design makes CPU speed changing easier.
- IO port signal processor via IRQs, DRQs, DMA.
- On board DCC2 x bus (PPO serial port) and PCI Enhanced IDE (Mode 3) for primary and secondary ports.
- Green feature to slow down / stop the CPU clock & turn off VGA display signals.
- Supports D34 CPU by a safe-proof 3.3V daughter board (D34D32).
- On board CPU cooling fan power socket can be switched off automatically in green mode.
- LED indicators for 3.3V or 5V operation.
- Dallas 1287A RTC chip provides high reliability for CMOS setup.

Note:

PIIC: Intel D34-180 Wire Through CPU

PQ4D: Intel D34-180 Wire Back CPU

PQ4T: Intel Quadrive CPU

AMD Enhanced CPU: AMD D34-180 Wire Back CPU

This mother board has been designed to work with a wide range of CPUs from various vendors. See it according to the type of CPU used.
WARNING: If you are using a J486, 3.3V or 2V CPU, please connect your board to a special "D34D32" daughter connector.

JP6: Flash ROM Power Select

1-2	3 Vcc
2-3	12 Vcc

This mother board can use a FLASH ROM in order to change its system BIOS through software. This allow you to instantly update your system BIOS as changes are made. Should you wish to use this feature then you must use the jumper according to the voltage of the FLASH ROM. When using FLASH ROMs a Flash Memory Writer Utility software should be used. For details see the diskette please contact your dealer or sales representative.

2.2 Cont...

PS1	Power Connector
KB	Keyboard Connector
CD	Secondary IDE Connector
CD1	Primary IDE Connector
CDW0	Hard Connector
CDW4	Game Port Connector
CDW5	COM1/0 Connector
CDW6	COM2/4 Connector
CDW7	Printer Port Connector

SECTION 2.3 Cont...

SPECIFICATIONS

To assist you in locating the necessary jumpers in order to configure your system, the following graphical guide has been added for jumper location.

SECTION 2.2 Cont.

Default (indicated here) represents default setting.

FS1: Power Supply Connector Pin Assignment

1	Power Good
2	+5V
3	+12V
4	-12V
5	Ground
6	Ground
7	Ground
8	Ground
9	-5V
10	-5V
11	+5V
12	-5V

These connections are for the system to receive power supply information. This connector can only be connected in one specific way to avoid any unwanted signalizations. This also contains the "Power Good" signal. This is a signal from your power supply which notifies that the system board is ready enough to release its power to. Should your power supply not have a "Power Good" signal, then you should choose the correct "On-board Power Good" on the motherboard as per jumper J24.

J21, J23, J24: Reset Signal For different version Chipset (Factory Setting)

Chip version	J21	J23	J24
UDriver 7	2-3	2-3	2-3
MicroMIPS	2-3	2-3	2-3

These jumpers are used to select the reset signal for different version of UM885. normally the jumper should be set to the delta 3 setting.

LED1: PCI IDE LED Connector

J28	LED amber
J29	LED red/blue

J22: Hardware Light Green Sticky Switch

None can line to go in suspend mode
Press another line to go back normal mode

Some system cases will also have a cable for switch on the case front which when pressed will automatically put the system in to / and out of "suspend" mode. Connect that cable first.

J27: Power Supply Power Drive Connector

This connector can add further power saving Green features to the new design power supply which has a cable connected to this jumper pin no. 2-3 for performing Green functions after the power time.

AMENDMENT OF FT-02A MANUAL PAGE 21

Note:
 P24C: Dual Core 486 to 486 Through CPU
 P24D: Dual Core 486 to 486 Write Back CPU
 P24T: Dual Core 486 CPU
 AMD K5-486 CPU: AMD DVA-140 Write Back CPU

This motherboard has been designed to work with a wide range of CPUs from various vendors. Set this according to the type of CPU used.
WARNING: If you are using a J-HEAT-UP or HP CPU, please ensure you have the optional "HEATUP" connector connected.

JF9: CPU Voltage Select

JF9	1.5 Volt
JF9	1.2 Volt
Default	1.5 Volt

This motherboard uses a FLASH ROM in order to change the system BIOS through software. This allows you to conveniently update your system BIOS as changes are made. Should you wish to verify the BIOS that you have set, this jumper according to the voltage of the FLASH ROM. When using FLASH ROMs a Flash Memory Write Utility software driver is required. For details on this driver please contact your dealer or sales representative.

JF5: Cpu M+ Enable

JF5	Cpu M+ Enable
Default	Open CPU

Short this jumper for using Celeron CPU.

JF21, JF23, JF26: P240 Select

JF21	Show
JF23	Show
JF26	Show

Short all three jumpers for using P240 CPU.

JF25: Select P240 or AMD DVA-140 CPU Write Back

1-2	For AMD DVA-140 Write Back CPU
2-1	For Dual Core CPU Write Back CPU
Default	Open CPU

JF12, JF13, JF14: CPU Clock Select

Clock Type	JF12	JF13	JF14
DMA0	1-1	1-2	1-1
DMA1	2-1	2-2	1-2
DMA2	3-1	3-2	1-2
DMA3	1-1	1-2	1-2
DMA4	2-1	2-2	1-2
DMA5	1-2	2-2	2-1

This selects the speed of CPU clock signal. Please note that some CPUs are clock-doubling or clock-tripling of the 100MHz clock.

JP15 : 3rd P1HC CPU Internal Clock Select

Option	Internal Clock
1-1	1.5 X External Clock
1-2	1 X External Clock

1104 CPUs can perform high speed processing due to internal clock multiplication. This type of CPU is capable of multiplying the clock by 200.1% and 1X to reach 100MHz speed. However CPU vendor recommends that it is far more stable to use the 1X clock speed. Therefore this is the default.

JP16 : Cooling Fan Power Connector

On all the cooling fan power cable to this connector, this the cooling fan can be controlled by power supply or CPU, please refer to JP12 in web.

JP17 : Power Good Connector

1-2	On Board Power Good Connector
-----	-------------------------------

Most power supplies produce a 'Power Good' signal which recognizes that the system board is stable enough to restore the power to. However this mother board also includes an on-board Power Good circuit for additional safety.

JP18 : Cooling Fan Control

Option	Cooling Fan Control
1-1	Control By Power Supply

This mother board has been equipped with an on-board power connector for the CPU cooling fan. The advantage of this feature is that as well as the CPU, the cooling fan itself can be slowed down according to the power management settings in the Green System BIOS. There are also options for control by BIOS or cooling fan permanently on.

JP19,JP40 : Cache Size Select

Cache Size	JP19	JP19	JP19	JP40	Cache RAM	Tag RAM
128KB	OPEN	OPEN	OPEN	1-3	32KB x 4	8KB x 1
256KB	1-2	OPEN	1-2	2-3	64KB x 4	16KB x 1
512KB	1-2,1-4	1-3	1-2	3-3	128KB x 4	32KB x 1

This selects the size and type of cache RAM on the mother board. This mother board can work with three types of cache RAM which allows for extra flexibility should you wish to upgrade. The jumper will be set accordingly during production.

JP18 : Cache VCC Select

JP18	Cache VCC
1-2,4-5	3.3V
2-3,1-4	5V

This jumper is used to select the VCC for 3.3V or 5V cache RAM.

JP15 : CPU Brand Select

Signal	JP15
Signal	JP15
Crst	1-3-4-6
JAMTMC	1-4-5-9

This selects the CPU brand to get the optimal performance of CPU.

All of the following jumpers share the same position

CM0 : Power LED & Key-Lock Connector

1	+5V
2	NC
3	Ground
4	Key-Lock
5	Ground

CM1 : Speaker Connector

1	Speaker Left
2	NC
3	Ground
4	+5V

JP24 : Turbo Switch

OPIN	Turbo Speed
CLOCK	Normal Speed

LED1 : Turbo LED Connector

TON 2.3 5V to 3.3V Daughterboard Board Installation (DX4/3.3V CPU)

Note: The user should read carefully all the procedures shown below before they go to install the 3.3V CPU and the 3.3V/5.0V daughter board (DX4DB2).

JP44 : 3.3V/5.0V Daughter Board (DX4DB2) Connector

An optional component which converts the voltage from 5V down to 3.3V/5.0V. Some CPUs, such as the Intel or AMD parts at 3.3V, if you want to use this CPU then you must first add this extra component. If you have not purchased this component please contact your dealer or sales representative.

3.3V/5.0V Daughter Board Installation (DX4 CPU or 3.3V/5.0V CPU)

Step 1. Insert the 4 mini-jumpers from JP44.

Step 2. Insert the DX4DB2 3.3V daughter board into the 8 pin header (JP44) and the 16 pin IDC socket (JP43).

Step 3. Refer to the above CPU Type Select Table to check the correct setting of the 3.3V CPU.

SECTION 2 Contd.

2.4 SIMM MEMORY Configuration

This motherboard can work with various types of SIMM module. It's non-locking feature means that you do not have to set any jumpers to designate its bank, size or type of SIMM - just insert the modules and the motherboard will auto-configure on booting up.

This motherboard supports 72-Pin SIMM module.

• 72-Pin

These are 72-pin modules (sometimes referred to as "old" or "old"). However they are fully 72-pin you only need to use one piece. Therefore this type of SIMM occupies one bank on its own. The exception to this rule is that some 72-pin modules are double sided and will occupy two banks. The table below shows you what types of SIMM are single or dual banked.

RAS Signals - The UMC chipset of this motherboard supports 4 RAS signals. Each of these RAS signals is expanded to two banks. Therefore this motherboard can support 8 banks.

Some 72-pin SIMM modules are double-bank as mentioned above. This means that although they only occupy one socket, they require 2 RAS signals. To help you with identifying the type of 72-pin module your system uses please refer to the table below.

SIMM TYPE	RAS Signals used For 1 Pin SIMM	TOTAL MEMORY For 1 Pin SIMM
128k x 32 (Non-Parity)	one - single bank	1 MB
256k x 32 (Parity)	one - single bank	1 MB
512k x 32 (Non-Parity)	two - dual bank	2 MB
1024k x 32 (Parity)	two - dual bank	2 MB
1M x 32 (Non-Parity)	one - single bank	4 MB
1M x 32 (Parity)	one - single bank	4 MB
2M x 32 (Non-Parity)	two - dual bank	8 MB
2M x 32 (Parity)	two - dual bank	8 MB
4M x 32 (Non-Parity)	one - single bank	16 MB
4M x 32 (Parity)	one - single bank	16 MB
8M x 32 (Non-Parity)	two - dual bank	32 MB
8M x 32 (Parity)	two - dual bank	32 MB

PT-432A CPU Type Select

UMC SX-40	2-3	1-2	1-2	2-4,3-5	1-2,3-4	2-3	1-2	open	open	open	open	2-3	open	open	3-4

Note: 1) If you are using a 3.3V, 3.45V or 4V CPU, please ensure that you have the optional 'DX4DB' or 'DX4DB2' converter is connected.

2) For both IT DX/DX2, ST DX/DX2 or IBM DX/DX2 CPU, the jumper setting is exactly the same as Cyrix DX/DX2 CPU.

3) Short JP31, JP33 and JP36 for Intel DX4-100 WB S CPU (P24D).

Refer to the PT-432A user's manual for more details information.

SECTION 5 - TROUBLE SHOOTING GUIDE

5.1 No Display After Power On

Check the following points if you face a "No Display" problem after power on.

- The interface cable must be inserted into the system plate properly and the gold fingers on it must be clean. The gold fingers can be cleaned with foam or alcohol.
- The CPU must be installed on the CPU socket (CPU) in the correct direction. If the CPU is inserted in a wrong direction, it will cause the "No Display" problem. The worst case is that the CPU may be destroyed.
- The clock chip speed (7313, P314, P315) must be set to match with the CPU speed. If the clock chip speed is set faster than the CPU speed, e.g. 50MHz clock chip speed with a 30MHz CPU, the system will have no display after power on.
- The SDRAM must be inserted in the sockets (SDA), (SND) properly and have complete contact with the socket pins. Otherwise there will be a "No Display" problem.

5.2 Cannot Boot Up

Check the following points if you face a "Cannot Boot Up" problem.

- The cache RAM setting (CP4) must be correct and the SRAM must be inserted in the correct position. Otherwise there will be "Cannot Boot Up" problem.
- Make sure the hard disk drive / floppy disk drive / IDE controller card / Super I/O card is in good condition. The cables must be connected in time to the correct devices. Otherwise there will be "Cannot Boot Up" problem.

5.3 Lose CMOS Data

Check the following points if you face a "Lose CMOS Data" problem.

- The RTC 10021987 must be inserted correctly (which contained a battery inside). Otherwise there will be "Lose CMOS Data" problem.

5.4 No System Management Mode

Check the following points if you face a "No System Management Mode" problem.

- Check the CPU type. The 386/486 CPUs can support all the DOZE, STANDBY, INACTIVE modes while the non-386/486 CPUs can support only the DOZE mode.
- The CPU type select jumpers (P19-P1, P21-P, P3), (P3) must be set to match with the CPU type. Otherwise there will be "No System Management Mode" problem.

5.5 General Notes

1. If on the first time installation, an error message "CMOS CHECKSUM ERROR" appears on the screen, please follow these steps: (1) Leave the system on for about 15-20 minutes to recharge the battery, then you can enter the system configuration; (2) Alternatively, leave your system on for about 24 hours to recharge the battery fully.
2. If you have switched off the computer system for more than two weeks, you might be required to recharge the battery fully.
3. Any hard disk with longer than 1.5m standard type is not recommended for used with PT-412A. Too long a hard disk cable will cause the Green PC circuit unable to monitor the hard disk activity.
