1.6 What is AGP?

The Accelerated Graphics Port (AGP) is a new port on the Host-To-PCI bridge device that supports an AGP port. The main purpose of the AGP port is to provide fast access to system memory.

The AGP port can be used either as fast PCI port (32-bits at 66MHz vs. 32-bits at 33MHz) or as an AGP port which supports 2x data-rate, a read queue, and side band addressing. When the 2x-data rate is used the port can transmit data at 533MB/sec ($66.6 \times 2 \times 4$). The read-queue can be used to pipeline reads – removing the effects of the reads-latency. Side band addressing can be used to transmit the data address on a separate line in order to speed up the transaction.

3. HARDWARE INSTALLATION

3.1. UNPACKING

The mainboard package should contain the following:

- The **6BXDU** mainboard.
- The Retention Mechanism & Attach Mount
- USER'S MANUALS for mainboard & SCSI device.
- Adaptec User's Guide.
- Cable set for IDE, Floppy, SCSI devices.
- Diskettes and CD for Mainboard Utility.
- External LVD SCSI port adapter.

The mainboard contains sensitive electric components, which can be easily damaged by static electricity, so the mainboard should be left in its original packing until it is installed.

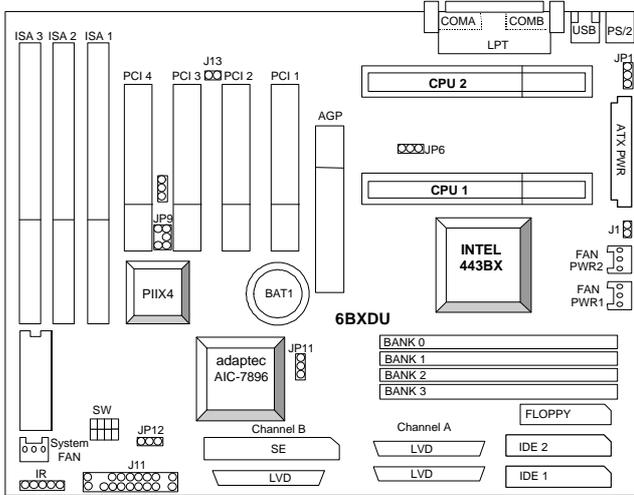

Unpacking and installation should be done on a grounded anti-static mat. The operator should be wearing an anti static wristband, grounded at the same point as the anti-static mat.

Inspect the mainboard carton for obvious damage. Shipping and handling may cause damage to your board. Be sure there are no shipping and handling damages on the board before proceeding.

After opening the mainboard carton, extract the system board and place it only on a grounded anti-static surface component side up. Again inspect the board for damage. Press down on all of the socket IC's to make sure that they are properly seated. Do this only on with the board placed on a firm flat surface.

⚠ DO NOT APPLY POWER TO THE BOARD IF IT HAS BEEN DAMAGED.

3.4. DRAM INSTALLATION

The mainboard can be installed with 16 / 32 / 64 / 128 / 256 MB 168 pins DIMM module DRAM. The DRAM memory system on mainboard consists of bank 0, 1, 2 & bank 3.

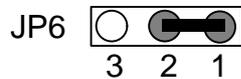

Since 168 pins DIMM module is 64 bits width, using 1 PCS which can match a 64 bits system. The total memory size is 16MB ~ 1 GB SDRAM. The DRAM installation position refer to Figure 3.1, and notice the Pin 1 of DIMM module must match with the Pin 1 of DIMM socket. Insert the DRAM DIMM module into the DIMM socket at Vertical angle. If there is a wrong direction of Pin 1, the DRAM DIMM module couldn't be inserted into socket completely.

3.5. CPU SPEED SETUP

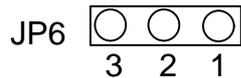

The system bus speed can be set to 66MHz or 100MHz form the jumper (**JP6**). The user can change the DIP SWITCH (**SW**) selection to set up the CPU speed for different processors. The CPU speed must match with the frequency RATIO and Front Side Bus (FSB) speed. It will cause system hanging up if the

frequency RATIO and FSB Speed do not match with the CPU.

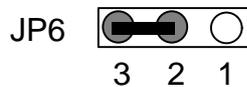

Set system speed to 66MHz: JP6 pin 1-2 short will cause system always run at 66 MHz FSB (Front Side Bus).

Set system speed to 100MHz: JP6 all pins open will cause system always run at 100MHz FSB.

Set system speed to Auto: JP6 pin 2-3 short will detect system speed 66/100MHz FSB automatically.

⚠ **The CPU is a sensitive electric component and it can be easily damaged by static electricity, so users must keep it away from metal**

surface when the CPU is installed onto main board.

3.6. CMOS RTC & ISA CFG CMOS SRAM

There're RTC & CMOS SRAM on board; they have a power supply from external battery to keep the DATA inviolate & effective. The RTC is a REAL-TIME CLOCK device, which provides the DATE & TIME to system. The CMOS SRAM is used for keeping the information of system configuration, so the system can automatically boot OS every time. Since the lifetime of internal battery is 5 years, the user can change a new Battery to replace old one after it cannot work.

3.7. SPEAKER CONNECTOR INSTALLATION

There is a speaker in AT system for sound purpose. The 4 - Pins connector SPK is used to connect speaker. Anode connects +, Cathode connects -.

3.8. HARDWARE RESET SWITCH CONNECTOR INSTALLATION

The RESET switch on panel provides users with HARDWARE RESET function. The system will do a cold start after the RESET button is pressed and released by user. The RESET switch is a 2 PIN connector and should be installed to **RST** on main board.

3.9. POWER LED CONNECTOR INSTALLATION

System has power LED lamp on the panel of case. The power LED will light on/off or flash to indicate which step on the system. The connector should be connected to PWR of main board in correct direction.

3.10. IDE & ATAPI DEVICE INSTALLATION

There are two-Enhanced PCI IDE ports (**IDE1, IDE2**) on board, which following ATAPI standard SPEC. Any one IDE port can connected to two ATAPI devices (IDE Hard Disk, CD-ROM & Tape Driver), so total four ATAPI devices can exist in a system. The **HD** is the active LED port for ATAPI devices.

3.11. SCSI DEVICE INSTALLATION

There are two ULTRA II SCSI channels on-board which both channel A and B have 68-pin Ultra II SCSI ports for Ultra Wide and Ultra II SCSI devices. Channel B has one 50-pin 8bit SCSI port for Ultra SCSI devices. Total of 30 SCSI devices (15 devices per channel) can exist within one system. The

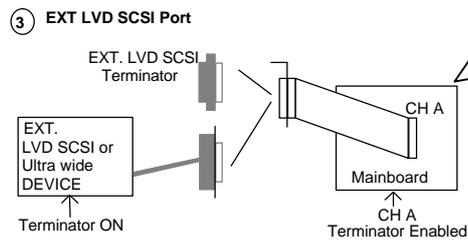

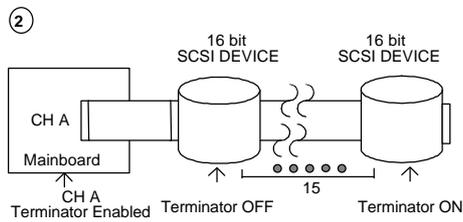

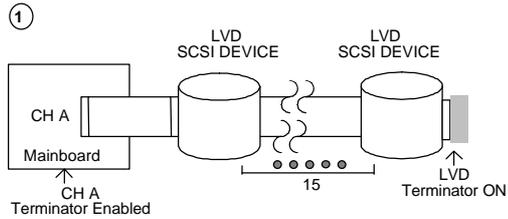

termination of the channel A and channel B can be adjusted from the **Integrated Peripherals** of the **CMOS SETUP MENU**. The termination of channel A can be set to "Enabled" or "Disabled". The termination of channel B can be set to "Both", "High Byte", "Low Byte", or "None" for those types of the SCSI devices which being connected to the SCSI ports to ensure proper functionality.

Adaptec 78xx Family Driver Installation for Windows NT CDROM Boot

Installing Windows NT V4.0

The following instructions explain how to install the Adaptec 7800 Family Manager, while installing Windows NT V4.0 from CDROM Boot.

1. Start your system with the Windows NT Boot CD in the CDROM drive.
2. During the initial stages of the boot process as soon as you see blue screen of "Windows NT Setup" then press F6.
3. Press S again to specify an additional device.

4. Select "Other" and feed it the Adaptec 7800 Family Manager diskette for WinNT 3.5x, 4.0/d2.11 then press Enter.

5. For Ultra2 host adapters(AIC-7890/AIC-7896), Select the "Adaptec AHA-294xU2/295xU2/AIC-789X PCI Ultra2 SCSI Controller(NT 4.0)" and press ENTER.

6. Then follow the normal Windows NT installation procedure to complete the setup processor.

3.12. PERIPHERAL DEVICE INSTALLATION

After the I/O device installation and jumpers setup, the mainboard can be mounted into the case and fixed by screw. To complete the mainboard installation, the peripheral device could be installed now. The basic system needs a display interface card. If the PCI - Bus device is to be installed in the system, any one of four PCI - Bus slots can be used.

3.13. KEYBOARD & PS/2 MOUSE INSTALLATION

The main board supports PS/2 Mouse (**J1**). The BIOS will auto detect whether the PS/2 Mouse is installed or not & assign IRQ12 for PS/2 Mouse port if it is installed. After installing the peripheral device, the user should check everything again, and prepare to power-on the system.
